SUMMARY

My main areas of expertise are *Computational Mechanics and Material Science* and *Materials Genome*. My goal is to develop a *synergistic interaction among computation, experiment, and theory* to design new advanced materials with superior properties at a fraction of current cost and time-to-market. Specifically, I focus on *developing theoretical/numerical tools* to understand the multi-scale/physics response of materials. I am utilizing various analytical methods, including atomistic-, meso-, and macro-scale models/simulations, along with experimental techniques with atomic resolutions to achieve this goal. In particular, I will study materials and processes for *additive manufacturing, low-dimensional electronic materials, materials for energy applications, materials under extreme conditions, and metamaterials*.
